

\$Alpha Dragon Project RFP

Summary

- The project creators are seeking candidates for new project direction. All codebase, assets and a community token are available to the incoming team.
- The ideal candidates are data analytics and blockchain engineers who have a special interest in composable token data and community development.
- Project assets include a [live prototype](#), a [Github repo](#), a [webpage](#), an [open-source sandbox](#), a [vision paper](#), a [TG community](#), an [X account](#), and a [community token](#) launched on Clanker.

\$Alpha Dragon

Dragon is a browser extension that serves as a token analytics companion while trading. The core thesis is that noisy token data can be broken down to modular signals that reveal patterns in volume changes. This contrasts the current state of Web3: token data scattered across platforms that over stimulate users with too much information.

The project creators are casual retail traders who built the prototype. They propose a path to explore how AI can identify patterns in token data and discover new “Alpha.”

RFP Process

Project creators will chat with candidates informally without an application procedure. As new team devs are onboarded, the project Safes will expand to include their signatures. The project creators and the new team will reach an agreed founder fee cap, after which all project governance, infrastructure, repositories, community accounts, and credentials will be transferred to the new stewards.

Please reach out with interest using these contact channels:
